

On the Composition of Documents

a working demonstration of the press framework

Greg Laurent

September 2026

The Argument

A document, in press, is nothing more than a set of sections. Each section is a matched pair bound by a shared name — the content beside its renderer. Neither the framework nor this page knows what the other sections are.

Because the pairing is by name and the ordering lives in one place, a document grows only by adding a pair and listing it. Structure becomes composition, not configuration.

The press mark — loaded from this document's assets/ folder.

Three Properties

- Sections are matched pairs, discovered by name — the renderer finds its own content.
- Order is arbitrary: any combination of pairs yields any structure.
- Formatting is external — every visual choice arrives through the formatter.
