

On the Composition of Documents

a working demonstration of the press framework

Greg Laurent

September 2026

The Argument

A document in Press is composed through functions. Content files hold prose or structured values. Their paired renderers decide how to present them, drawing on a supplied formatter for typography.

Matching names make the relationship easy to follow. Imports make it explicit. A renderer may combine several sources, and a composition may group other compositions. The document chooses the order; Press supplies no fixed structure.

The press mark — loaded from this document's assets/ folder.

Three Properties

- Matching filenames pair content with its presentation by convention; renderers import their sources explicitly.
- Composition selects and orders renderers, which can share content and form nested groups.
- The formatter supplies typography; each renderer owns its document-specific arrangement.
